Category	Description	Reviewers Comment	Action taken by reviewed group
Build	Could you clone from Git and build using the README file?	I could not build from the Readme, but I was not able to build because I did not have an android and the emulator does not work on my computer. It seems like it worked though for someone else in my group so I think it should work.	
Legibility	Was the flow sane and were variable names and methods easy to follow? Does the code adhere to general guidelines and code style?	Pretty much everything seemed good on this front for variable names. There were a few lamda functions that were unneeded as they just called another function and some lines that were commented out that should probably just be deleted, but otherwise everything seemed good.	
Implementation	is it shorter/easier/faster/cleaner/ safer to write functionally equivalent code? Do you see useful abstractions?	For this I would just remove all of the commented-out code. The overall practice of the code seemed pretty good and had a good amount of comments to make code clear.	
Maintainability	Are there unit tests? Should there be? Are the test covering interesting cases? Are they readable?	It is almost impossible to write test cases for a front end, so the only test cases that I would recommend are maybe a few tests for the backend, but	

		because of how crazy your backend is that might not be possible either.	
Requirements	Does the code fulfill the requirements?	It seemed to fulfill all the requirements.	
Other	Are there other things that stand out that can be improved?	Nothing to add, it looks like the coding standards are pretty good once the extra code is removed.
